

A Repeated nested cross-validation

Development set n=309; 5 folds × 10 repeats; model selection confined to training folds

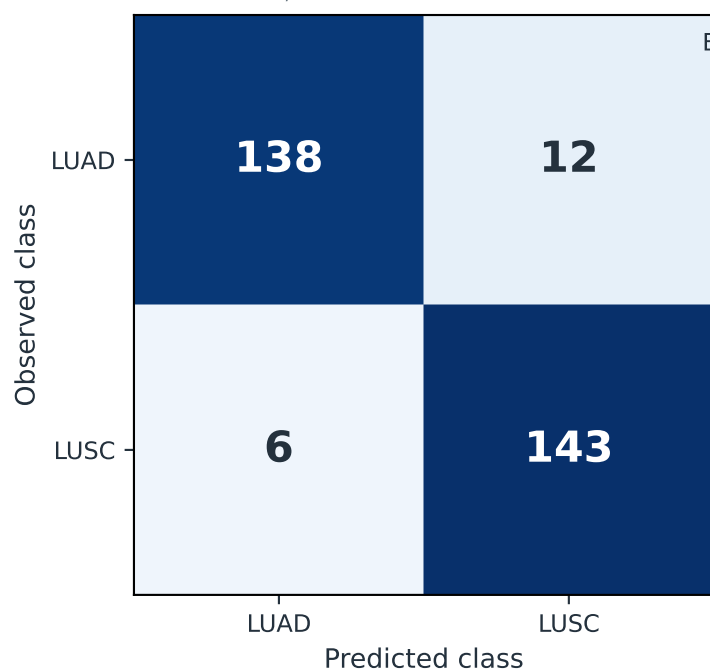

B Held-out discrimination

Internal held-out test n=299

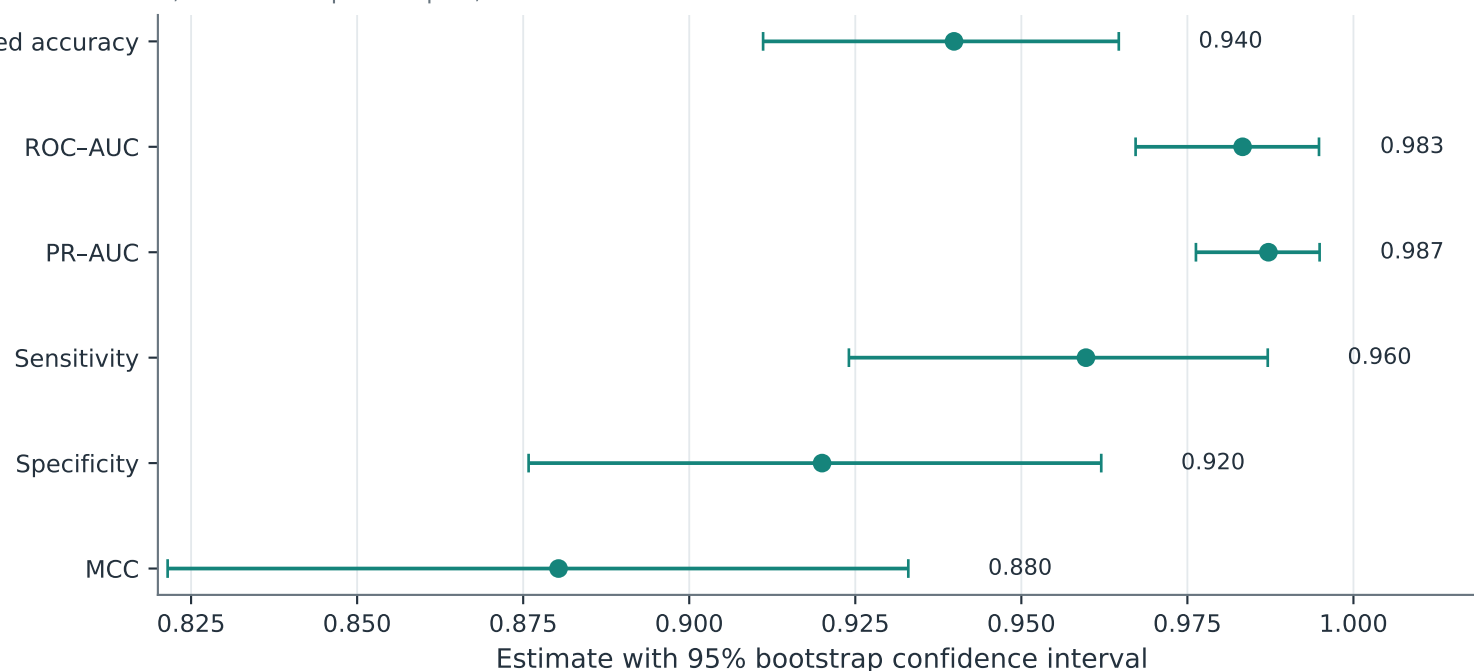

C Held-out confusion matrix

LUAD n=150; LUSC n=149

D Held-out performance uncertainty

1,000 bootstrap resamples; estimates were not used for model selection

Model: class-weighted logistic regression; fold-local median imputation, z-score scaling, and univariate feature selection. Positive class for ROC/PR: LUSC.
